More Connected

Global scale and capacity

200+ countries and territories

2,000+ Points of Presence

38 cable landing stations

30+ submarine cable systems

35 diverse paths through major Asian cities

100G technologies supported on most cable systems

400,000+km network cable length

More Resilient

Reliable, resilient service

- High capacity, meshed IP backbone in Asia with data encryption and proactive maintenance.
- Core PoPs provide hardware redundancy and diverse routes.
- Service provides zero preventable outages, as measured by percentage of traffic impacted.
- Diverse carrier model with paths out of key hubs (including Australia, Hong Kong, Japan, Singapore and the US) to ensure uptime and accommodate one or more cable failures.

Unique, diverse cable routes

- Innovative cable routes designed to bypass difficult topology (such as earthquake-prone areas) to provide stable connectivity.
- Routes are reconfigured creatively to forge new connections, such as between Korean and Taiwan directly.
- Multiple cable landings within the same country with diverse backhaul routes and partners for fibre and facilities.
- Infrastructure and platform diversity across our Points of Presence (PoPs) and cable landings, including diverse power, clustered platforms, high availability management systems and observability.
- Blast zone management and decoupled components to avoid dependency on monolithic platforms and limit the scope of change.
- Investment in routes based on the changing needs of our customers, diversity requirements and geopolitics.

24/7/365 proactive protection and response

- 24/7 Network Operations Centre (NOC) services.
- High-capacity services with bandwidth availability service level assurance and guarantee.
- Submarine cable protection and repair, including our automatic identification system, guard boats, protection zones, cable burial and cable awareness programme.
- Ongoing maintenance repair services, with personnel dispatched to address problems if required.
